Circle, Palo Alto, CA 94303, USA

This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Pusion (TM) cloning system between the Sall and HindIII sites of the pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after last codon and before HindIII site to maintain reading frame.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        80
                                                                                                                                                                                                                                                                      The invention relates to a method of treating an angiogenesis-mediated disorder in a subject. The method is useful for treating angiogenesis-mediated disorder, e.g., retinal or choroidal neovascularisation or diseases associated with chronic inflammation, myocardial ischaemia, stroke, coronary artery disease or peripheral vascular disease. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       13 ATGGACGTCACCATCCAGCACCCTTGGTTCAAGCGCGCCCTGGGGCCCTTCTACCCCAGC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          77
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of treating an angiogenesis-mediated disorder in a subject. The method is useful for treating angiogenesis-mediated disorder, e.g., retinal or choroidal neovascularisation or diseases associated with chronic inflammation, myocardial ischaemia, stroke, coronary artery disease or peripheral vascular disease. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ArgleuPheAspGlnPhePheGlyGluGlyLeuPheGluTyrAspLeuLeuProPheLeu

                                                                                                                   The invention relates to a chimera alpha BNAC polynucleotide that encodes a chimeric alpha BNAC polypeptide. The polypeptide is useful for preventing protein aggregation. The polypeptide is also useful for increasing the shelf life of proteins of pharmaceutical value. The polypeptide shows an increase in accessible hydrophobic regions, forms larger size oligomers, shows an increase in intersubunit interaction, forms larger process oligomers and shows increased allipticity as compared to eye lens crystallins alpha A and alpha B. The tryptophan residues in the polypeptide are less solvent accessible as compared to those of eye lens crystallins alpha A and alpha B. The polypeptide stowe extraordinarily high chaperone-like activity ranging between 3 - 6 times that of the eye lens crystallins alpha A and alpha B. The present sequence represents the chimera DNA that encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      357
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     417
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    155
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 477

```
New truncated alpha-crystallin polypeptide derived from a wild-type alpha -crystallin protein, useful for enhancing protein (e.g. insulin or alcohol dehydrogenase) expression or secretion and for preventing protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a truncated alpha-crystallin polypeptide derived from a wild-type alpha-crystallin protein, where the truncated dolypeptide lacks an N-terminal sequence present in the wild-type protein. The composition and methods are useful for enhancing protein (e.g. insulin or alcohol dehydrogenase) expression or secretion and for preventing protein agreegation. These may also be used for creating a thermophilic host that tolerates elevated temperatures. The present sequence represents human N-terminal truncated alpha-crystallin DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              71 PheValllePheLeuAspValLysHisPheSerProGluAspLeuThrValLysValGln 90

for determining the level of RNA expression for a sample, determining the phenotype of a cell and distinguishing cell types. The gene or a protein expression profile is useful in identifying disease pathologies involving alterations of gene expression. The assessment of expression profiles may provide meaningful information with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein expression profile may also be used for creating microarrays. The microarray is useful for generic and physical mapping of genomes, DNA sequencing, genetic or medical diagnosis, genotyping of genomes, DNA sequencing, genetic or identifications and in identifying promising antibiotics, antiviral or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   115

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising an isolated amino acid sequence that comprises a portion of human mitochondrial malate dehydrogenase protein (MDH), particularly the minimun activator of DNA fragmentation sequences. The composition is useful for treating cancer chosen from liver cancer, head cancer, head cancer, head cancer, concer, breast cancer, covarian cancer, stomach cancer, oesophagus cancer, colon cancer, covarian cancer, skin cancer, muscle cancer, mouth cancer, brondle cancer, gancer, cancer, cancer, cancer, cancer, cancer, cancer, uterus cancer, wascle cancer, theat cancer, bronchial cancer, cartilage cancer, uterus cancer, that cancer, cancer, uterus cancer, thymbhoma cancer, uterus cancer, thymbhoma cancer, spleen cancer, thymbhoma cancer, spleen cancer, thymbhoma cancer, spleen cancer, thymbhoma cancer, spleen cancer, thymbhoma cancer, pall bladder cancer, thyroid cancer, brain cancer, neuron cancer, gall bladder cancer, color action cancer, spleen cancer, thymbhoma, leukaemia, melanoma, squamous call cancer, cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 AGCCGCCTCTTTGACCAGTTCTTCGGAGAGCACCTGTTGGAGTCTGATCTTTTCCCG--- 117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New compositions comprising proteins and encoding nucleic acids having a DNA nuclease or cell killing activity and are operably linked to cancer cell binding antibodies or growth factors, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         56 ValleuAspSerGlyIleSerGluValArgSerAspArgAspLysPheValIlePheLeu 75

The invention relates to a hybrid protein chaperone for stabilising proteins and/or protein activities. Protein chaperones (also known as heat shock proteins) are divided into 4 families on the basis of their primary sequence and chaperone properties: HSP90, HSP90, HSP60 and sHSP (small heat shock protein). The invention is based upon the finding that among the sHSP panely, which have a general structure of a central domain (called the alpha-crystallin domain) flanked by N and C-terminal regions, replacement of one or more regions of an sHSP with the corresponding region from a second sHSP can improve the activity compared to native SHSPs. In a particular embodiament of the invention, the hybrid chaperone of sHSPS. In a particular embodiament of the invention can comprise central portion of alphaB-HSP27 comprising the N-terminus and central portion of alphaB-HSP27 comprising the N-terminus and central portion of alphaB-HSP27 comprising the N-terminus and central portion of alphaB-trystallin and the C-terminal tail of HSP27. However, the hybrid protein chaperones of the invention can comprise central portion of alphaB-trystallin and the creaminal trail of HSP27. The invention also encompasses methods for stabilising proteins solution using hybrid protein chaperones, diagnostic proteins, reporteins comprishing at least one protein chaperones or conjugates in an aqueous solution using hybrid protein chaperones, secondinal associated with the above hybrid protein chaperone. The hybrid protein chaperones are useful as agents to protein chaperone. The hybrid protein chaperones are useful as agents to protein chaperone. The hybrid protein of proteins diseases involving altered protein chaperone. The hybrid protein of proteins diseases of unfolding, for the treatment of diseases. The present sequence represents a mutant of protein agreed martine diseases. The present sequence represents a mutant of mutan alphaB-crystallin DNA sequence in which the date protein conformations (e.g., cardiomyopathies, cardiomyopathies, an alphaB-crystallin.

The invention relates to a hybrid protein chaperone for stabilising proteins and/or protein activities. Protein chaperones (also known as proteins and/or proteins) are divided into 4 families on the basis of their primary sequence and chaperone properties: HSP90, HSP70, HSP60 and sHSP (small heat shock protein). The invention is based upon the finding that among the sHSP family, which have a general structure of a cenral domain (called the alpha-crystallin domain) flanked by N and C-terminal regions, replacement of one or more regions of an sHSP with the corresponding region from a second sHSP can improve the activity compared to native sHSPs. In a particual embodiment of the invention, the hybrid chaperone is a hybrid sHSP designated alphaB-HSP27 comprising the N-terminus and central portion of alphaB-HSP27 comprising the N-terminus and central portion of alphaB-crystallin and the C-terminal tail of HSP27. However, the hybrid protein chaperones of the invention can comprise regions from HSP90, HSP70 and HSP60 families as well as from the sHSP

family. The invention also encompasses methods for stabilising proteins such as enzymes, therapuetic proteins, diagnostic proteins, reporter proteins or antibodies, their fragments or conjugates in an aqueous

New hybrid protein chaperone (e.g. heat shock protein) useful for stabilizing proteins and/or protein activities, or as an agent to prevent protein aggregation, or for treating diseases involving altered protein conformations. 136 AspGlyMetLeuThrPheCysGlyProLysIleGlnThrGlyLeuAspAlaThrHisAla 155 -----GTCTCTGGCCCT 473 Hybrid protein chaperone; protein stabilisation; heat shock protein; sHSP family; protein aggregation inhibition; cell death inhibition; genome stability pathway inhibition; protein denaturation identification; protein conformation related disease; cardiomyopathy; cataract; neurodegenerative disease; cardiant, ophthalmological; neuroprotective; gene therapy; alphaB-crystallin; wild-type; human; cassette mutagenesis; /note= "Mutagenesis of T to G at this site generates a unique AvaI site between bases 493-498" 474 GAGGGCACCATTCCCCATCACCGGGAAGAGAAGCCTGCTGTCACCGCAGCCCCC 527 Human wild-type alphaB-crystallin fragment-encoding DNA. 426 GATGGGGTCCTCACTGAATGGACCAAGGAAACAG----GluArgAlaIleProValSerArgGluGluLysPro-Location/Qualifiers replace (497,G) Disclosure; Fig 12; 45pp; English. cancer associated gene.

Renal

```
comprising at least one protein chaperones; stabilised protein formulation chaperone; mucleic acids and vectors encoding a hybrid protein chaperone; and the coexpression of a recombinant protein of interest and a hybrid protein chaperone; and the coexpression of a recombinant protein of interest and a hybrid protein chaperone. The hybrid protein chaperones are useful as agents to provent protein agregation, as inhibitors of cell death and genome stability pathways. for identification of proteins that are in the process of unfolding, for the treatment of diseases involving altered process of unfolding, for the treatment of diseases involving altered reurodegenerative disease), or for the manufacture of a medicament for the treatment of such diseases. The present sequence represents a wild: type human alphab-crystallin DNA sequence. The T at position 497 was mutated to G (see ADE75374) to generate a unique AvaI restriction site which was used for subsequent cassette mutagenesis (along with a vector-based SacI site) to introduce heterologous C-terminal sequences onto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               245

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by an unclaic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AGCCGCCTCTTTGACCAGTTCTTCGGAGAGCACCTGTTGGAGTCTTTTTCCCG--- 142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            85

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity, and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ebner R, Endress G, Horrigan S;

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent neoplastic activity, determining a change in expression of at least one gene (1) of a signature gene set, where (1) comprises a sequence (S) selected from 847 sequences (given in ABL61664 or ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oseophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Horrigan S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867-ABT1112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnosit markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention. Note: The sequence data for this patent electronic format directly from WIPO at

                                                                      8
                                                                                                                                        ð
                                                                                                                                                                                                                                      The invention relates to a method of diagnosing (I) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) for or identifying an agent that modulates the onset or progression of BPH.

The method is based on changes in gene expression in BPH issue isolated from patients exhibiting different clinical states of prostate of BPH.

The method is based on changes in gene expression in BPH issue isolated from patients expression levels of one or more genes in prostate cells from the subject that are differentially regulated compared to normal prostate cells. (II) comprises preparing a first gene expression profile of BPH cells or BPH-like cell population, exposing the calls to the agent, preparing a second gene expression profile of the agent exposed cells, and comparing the first and second gene expression of BPH. (II) is useful for identifying an agent that modulates the onset or progression of BPH.

The methods are useful to present information identifying the expression of genes given in the specification in the issue or cells, by comparing the expression level of expression of gene in the database, and displaying the expression levels of at least one gene in the tissue or cell sample compared to the expression level in a tissue or series of at least one gene in the insue or cell sample compared to the expression level in path and path
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AGCCGCCTCTTTGACCAGTTCTTCGGAGACACCTGTTGGAGTCTGATCTTTTCCCG--- 142

A complex of the invention has virucide and cytostatic activity, and may have a use as vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered level of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09584-ADF09697 represent cDNA's of the

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ds; breast cancer; prognosis; gene expression; diagnosis

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aregacarceccáricaccaciócicada arececió es contrationar contrationes ana aregación de arececión d

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        202
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      262

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA ilbraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used

                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                            The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTs sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating oDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. ESTs are derived from mRNAs with intect 5' ends and ear therefore be use to obtain contain full length cDNAs and cannot be use to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MetAspValThrileGlnHisProTrpPheLysArgThrLeuGlyProPheTyr---Pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diagnostic, forensic, gene therapy and chromosome mapping procedures
                          nucleic acid that is a 5' expressed sequence tag (5' EST) for ining cDNAs and genomic DNAs that correspond to 5'ESTs and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; SEQ ID NO 14936; 71pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 927 BP; 230 A; 267 C; 224 G; 206 T; 0 U; 0 Other;

An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of

mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              115

                                                    This invention describes novel human nucleic acid sequences from normal breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer and for treating illnesses associated with fat metabolism. The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                              toxic effect; gene expression profile; hepatotoxicity; diagnostic marker; toxicity marker; toxicity progression; drug screening; primary rat hepatocyte toxicity modelling; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox mean values.
                                                                                                                                                              Primary rat hepatocyte toxicity modelling related gene SEQ ID NO:3184

The invention relates to a novel method of predicting at least one toxic effect of a compound. The method comprises a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising at least part of the data or information given in the specification. The methods are useful for predicting at least one toxic effect of a compound, predicting the progression of a toxic effect of a compound, predicting the progression of a toxic effect of a compound, predicting the renal toxicity of a compound, or identifying toxicity markers in tissues or cells exposed to known renal toxin. The genes are useful as toxicity markers in drug screening and toxicity assays, in monitoring disease or physiological states, or disease progression. This polymucleotide represents a rat DNA sequence relating to the toxic effect database comparative in the specification. NOTE: The sequence data for this patent of the printed specification, but was obtained in electronic format directly from the World Intellectual Property
                                                                                                                                                                                                                                                                                                                                                                                                            Predicting at least one toxic effect of a compound, useful for toxicity modeling, comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression
                                                                                                                                                                                                                                                                                                                                          Ξ

The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the global changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells. Also included are methods of predicting at least one toxic effect of a compound or progression of a toxic effect, preferably the

```
cc expression in a tissue or cell sample exposed to the compound of two or carpression in a tissue or cell sample exposed to the compound of two or core expression in the specification, where differential expression of the genes is indicative of at least one toxic effect or progression. The cresponse and predict callular pathways that a compound modulates in a cell. The methods utilise a set of at least two probes (on a solid consport in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer system comprising a database containing information identifying the expression level in a tissue or cell sample exposed to a hepatotoxin of set of genes comprising at least two genes listed in the specification, conformation level in a tissue or cell of at least one gene containing the expression level in a tissue or cell of at least one gene containing the expression level in a tissue or cell of at least one gene changes in gene expression and for identifying toxicity markers in the specification. The method is useful for elucidating global charges in drug screening and toxicity searys. The genes and toxicity markers in drug screening and toxicity searys. The genes and containing containing the that has been exposed to a compound or agent. Hepatotoxicity is characterised by centrilobular necrosis and steatosis. The present containing the sample that has been expessed equence tag (EST) or cDNA derived from a gene compound or agent. Hepatotoxicity is sequence is an expressed sequence tag (EST) or cDNA derived from a gene compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1047
